

Ultra-compact high-performance eCompass module: 3D accelerometer and 3D magnetometer

Datasheet - production data

Features

- 3 magnetic field channels and 3 acceleration channels
- From ± 1.3 to ± 8.1 gauss magnetic field full scale
- $\pm 2g/\pm 4g/\pm 8g/\pm 16g$ linear acceleration full scale
- 16-bit data output
- I²C serial interface
- Analog supply voltage 2.16 V to 3.6 V
- Power-down mode / low-power mode
- 2 independent programmable interrupt generators for free-fall and motion detection
- Embedded temperature sensor
- Embedded FIFO
- 6D/4D-orientation detection
- ECOPACK[®] RoHS and “Green” compliant

Applications

- Tilt-compensated compasses
- Map rotation
- Position detection
- Motion-activated functions
- Free-fall detection
- Click/double-click recognition
- Pedometers
- Intelligent power-saving for handheld devices

- Display orientation
- Gaming and virtual reality input devices
- Impact recognition and logging
- Vibration monitoring and compensation

Description

The LSM303DLHC is a system-in-package featuring a 3D digital linear acceleration sensor and a 3D digital magnetic sensor.

The LSM303DLHC has linear acceleration full scales of $\pm 2g$ / $\pm 4g$ / $\pm 8g$ / $\pm 16g$ and a magnetic field full scale of ± 1.3 / ± 1.9 / ± 2.5 / ± 4.0 / ± 4.7 / ± 5.6 / ± 8.1 gauss.

The LSM303DLHC includes an I²C serial bus interface that supports standard and fast mode 100 kHz and 400 kHz. The system can be configured to generate interrupt signals by inertial wake-up/free-fall events as well as by the position of the device itself. Thresholds and timing of interrupt generators are programmable by the end user. Magnetic and accelerometer blocks can be enabled or put into power-down mode separately.

The LSM303DLHC is available in a plastic land grid array package (LGA) and is guaranteed to operate over an extended temperature range from -40 °C to $+85$ °C.

Table 1. Device summary

Part number	Temperature range [°C]	Package	Packing
LSM303DLHC	-40 to +85	LGA-14	Tray
LSM303DLHCTR	-40 to +85	LGA-14	Tape and reel

		GN bits set to 111 ⁽²⁾ (Z)		205		

a. The product is factory calibrated at 2.5 V. The operational power supply range is from 2.16 V to 3.6 V.

Table 3. Sensor characteristics (continued)

Symbol	Parameter	Test conditions	Min.	Typ. ⁽¹⁾	Max.	Unit
LA_TCS0	Linear acceleration sensitivity change vs. temperature	FS bit set to 00		±0.01		%/°C
LA_TyOff	Linear acceleration typical Zero-g level offset accuracy ^{(3),(4)}	FS bit set to 00		±60		mg
LA_TCOff	Linear acceleration Zero-g level change vs. temperature	Max delta from 25 °C		±0.5		mg/°C
LA_An	Acceleration noise density	FS bit set to 00, normal mode(Table 8.), ODR bit set to 1001		220		ug/(√Hz)
M_R	Magnetic resolution			2		mgauss
M_CAS	Magnetic cross-axis sensitivity	Cross field = 0.5 gauss H applied = ±3 gauss		±1		%FS/ gauss
M_EF	Maximum exposed field	No permanent effect on sensor performance			10000	gauss
M_DF	Magnetic disturbance field	Sensitivity starts to degrade. Use S/R pulse to restore sensitivity			20	gauss
Top	Operating temperature range		-40		+85	°C

1. Typical specifications are not guaranteed.

2. Verified by wafer level test and measurement of initial offset and sensitivity.

3. Typical Zero-g level offset value after MSL3 preconditioning.

4. Offset can be eliminated by enabling the built-in high-pass filter.

2.2 Temperature sensor characteristics

@ Vdd = 2.5 V, T = 25 °C unless otherwise noted ^(b).

Table 4. Temperature sensor characteristics

Symbol	Parameter	Test condition	Min.	Typ. ⁽¹⁾	Max.	Unit
TSDr	Temperature sensor output change vs. temperature	-		8		LSB/°C ⁽²⁾
TODR	Temperature refresh rate			ODR ⁽³⁾		Hz
Top	Operating temperature range		-40		+85	°C

1. Typical specifications are not guaranteed.

2. 12-bit resolution.

3. For ODR configuration refer to [Table 72](#).

b. The product is factory calibrated at 2.5 V.

2.3 Electrical characteristics

@ Vdd = 2.5 V, T = 25 °C unless otherwise noted.

Table 5. Electrical characteristics

Symbol	Parameter	Test conditions	Min.	Typ. ⁽¹⁾	Max.	Unit
Vdd	Supply voltage	-	2.16		3.6	V
Vdd_IO	Module power supply for I/O		1.71	1.8	Vdd+0.1	
Idd	Current consumption in normal mode ⁽²⁾			110		μA
IddSL	Current consumption in sleep-mode ⁽³⁾			1		μA
Top	Operating temperature range		-40		+85	°C

1. Typical specifications are not guaranteed.

2. Magnetic sensor setting ODR = 7.5 Hz, Accelerometer sensor ODR = 50 Hz.

3. Linear accelerometer in sleep-mode and magnetic sensor in power-down mode.

2.4 Communication interfaces characteristics

External pull-up resistors are required to support I²C standard and fast speed modes.

2.4.1 Sensor I²C - inter IC control interface

Subject to general operating conditions for V_{dd} and T_{op}.

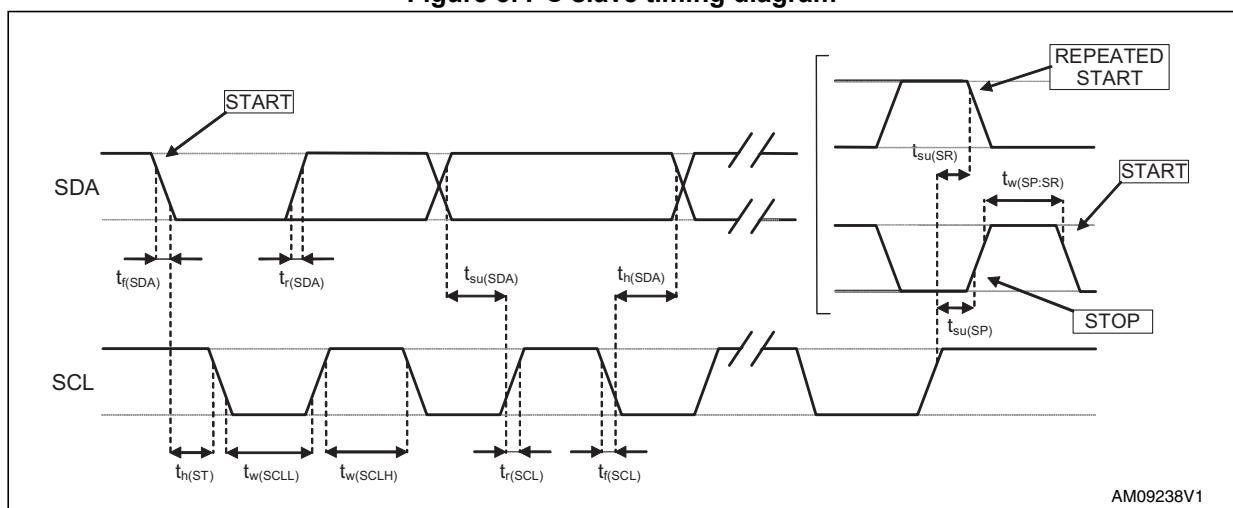

Table 6. I²C slave timing values

Symbol	Parameter	I ² C standard mode ⁽¹⁾		I ² C fast mode ⁽¹⁾		Unit
		Min.	Max.	Min.	Max.	
f_(SCL)	SCL clock frequency	0	100	0	400	kHz
t _{w(SCL)}	SCL clock low time	4.7		1.3		μs
t _{w(SCLH)}	SCL clock high time	4.0		0.6		
t _{su(SDA)}	SDA setup time	250		100		ns
t _{h(SDA)}	SDA data hold time	0.01	3.45	0.01	0.9	μs
t _{r(SDA)} t _{r(SCL)}	SDA and SCL rise time		1000	20 + 0.1C _b ⁽²⁾	300	ns
t _{f(SDA)} t _{f(SCL)}	SDA and SCL fall time		300	20 + 0.1C _b ⁽²⁾	300	
t_{h(ST)}	START condition hold time	4		0.6		μs
t _{su(SR)}	Repeated START condition setup time	4.7		0.6		
t_{su(SP)}	STOP condition setup time	4		0.6		
t _{w(SP:SR)}	Bus free time between STOP and START condition	4.7		1.3		

1. Data based on standard I²C protocol requirement, not tested in production.

2. C_b = total capacitance of one bus line, in pF.

Figure 3. I²C slave timing diagram

Note: Measurement points are done at 0.2·V_{dd_IO} and 0.8·V_{dd_IO}, for both ports.

2.5 Absolute maximum ratings

Stresses above those listed as “absolute maximum ratings” may cause permanent damage to the device. This is a stress rating only and functional operation of the device under these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 7. Absolute maximum ratings

Symbol	Ratings	Maximum value	Unit
V _{dd}	Supply voltage	-0.3 to 4.8	V
V _{dd_IO}	I/O pins supply voltage	-0.3 to 4.8	V
V _{in}	Input voltage on any control pin (SCL, SDA)	-0.3 to V _{dd_IO} +0.3	V
A _{POW}	Acceleration (any axis, powered, V _{dd} = 2.5 V)	3,000 for 0.5 ms	<i>g</i>
		10,000 for 0.1 ms	<i>g</i>
A _{UNP}	Acceleration (any axis, unpowered)	3,000 for 0.5 ms	<i>g</i>
		10,000 for 0.1 ms	<i>g</i>
T _{OP}	Operating temperature range	-40 to +85	°C
T _{STG}	Storage temperature range	-40 to +125	°C
ESD	Electrostatic discharge protection	2 (HBM)	kV

This device is sensitive to mechanical shock, improper handling can cause permanent damage to the part.

This device is sensitive to electrostatic discharge (ESD), improper handling can cause permanent damage to the part.

2.6 Terminology

2.6.1 Linear acceleration sensitivity

Linear acceleration sensitivity describes the gain of the accelerometer sensor and can be determined by applying 1 g acceleration to it. As the sensor can measure DC accelerations, this can be done easily by pointing the axis of interest towards the center of the Earth, noting the output value, rotating the sensor by 180 degrees (pointing to the sky) and noting the output value again. By doing so, ± 1 g acceleration is applied to the sensor. Subtracting the larger output value from the smaller one, and dividing the result by 2, leads to the actual sensitivity of the sensor. This value changes very little over temperature and also very little over time. The sensitivity tolerance describes the range of sensitivities of a large population of sensors.

2.6.2 Zero-g level

Zero-g level offset (TyOff) describes the deviation of an actual output signal from the ideal output signal if no acceleration is present. A sensor in a steady-state on a horizontal surface measures 0 g on the X axis and 0 g on the Y axis whereas the Z axis measures 1 g. The output is ideally in the middle of the dynamic range of the sensor (content of OUT registers 00h, data expressed as two's complement number). A deviation from the ideal value in this case is called Zero-g offset. Offset is, to some extent, a result of stress to the MEMS sensor and therefore the offset can slightly change after mounting the sensor onto a printed circuit board or exposing it to extensive mechanical stress. Offset changes little over temperature, see "Zero-g level change vs. temperature". The Zero-g level tolerance (TyOff) describes the standard deviation of the range of Zero-g levels of a population of sensors.

3 Functionality

The LSM303DLHC is a system-in-package featuring a 3D digital linear acceleration and 3D digital magnetic field detection sensor.

The system includes specific sensing elements and an IC interface capable of measuring both the linear acceleration and magnetic field applied to it and providing a signal to the external world through an I²C serial interface with separated digital output.

The sensing system is manufactured using specialized micromachining processes, while the IC interfaces are manufactured using CMOS technology that allows designing a dedicated circuit which is trimmed to better match the sensing element characteristics.

The LSM303DLHC features two data-ready signals (RDY) which indicate when a new set of measured acceleration data and magnetic data are available, therefore simplifying data synchronization in the digital system that uses the device.

The LSM303DLHC may also be configured to generate a free-fall interrupt signal according to a programmed acceleration event along the enabled axes.

Linear acceleration operating mode

The LSM303DLHC provides two different acceleration operating modes: “normal mode” and “low-power mode”. While normal mode guarantees high resolution, low-power mode further reduces current consumption.

Table 8 summarizes how to select the operating mode.

Table 8. Accelerometer operating mode selection

Operating mode	CTRL_REG1[3] (LPen bit)	CTRL_REG4[3] (HR bit)	BW [Hz]	Turn-on time [ms]
Low-power mode	1	0	ODR/2	1
Normal mode	0	1	ODR/9	7/ODR

3.1 Factory calibration

The IC interface is factory calibrated for linear acceleration sensitivity (LA_So), and linear acceleration Zero-g level (LA_TyOff).

The trim values are stored inside the device in nonvolatile memory. Any time the device is turned on, the trimming parameters are downloaded into the registers to be used during normal operation. This allows the user to use the device without further calibration.

4 Application hints

Figure 4. LSM303DLHC electrical connections

4.1 Capacitors

The C1 and C2 external capacitors should be low SR value ceramic type constructions (typ. recommended value 200 mOhm). Reservoir capacitor C1 is nominally 4.7 μ F in capacitance, with the set/reset capacitor C2 nominally 0.22 μ F in capacitance.

The device core is supplied through the Vdd line. Power supply decoupling capacitors (C4 = 100 nF ceramic, C3 = 10 μ F Al) should be placed as near as possible to the supply pin of the device (common design practice). All the voltage and ground supplies must be present at the same time to have proper behavior of the IC (refer to [Figure 4](#)).

The functionality of the device and the measured acceleration/magnetic field data are selectable and accessible through the I²C interface.

The functions, the threshold, and the timing of the two interrupt pins (INT1 and INT2) can be completely programmed by the user through the I²C interface.

4.2 Pull-up resistors

Pull-up resistors (recommended value 10 kOhm) are placed on the two I²C bus lines.

4.3 Digital interface power supply

This digital interface, dedicated to the linear acceleration and to the magnetic field signal, is capable of operating with a standard power supply (Vdd) or using a dedicated power supply (Vdd_IO).

4.4 Soldering information

The LGA package is compliant with the ECOPACK®, RoHS, and “Green” standard. It is qualified for soldering heat resistance according to JEDEC J-STD-020.

Leave “Pin 1 Indicator” unconnected during soldering.

Land pattern and soldering recommendations are available at www.st.com/mems.

4.5 High-current wiring effects

High current in the wiring and printed circuit traces can be culprits in causing errors in magnetic field measurements for compassing.

Conductor-generated magnetic fields add to the Earth’s magnetic field, causing errors in compass-heading computation.

Keep currents higher than 10 mA a few millimeters further away from the sensor IC.

5 Digital interfaces

The registers embedded inside the LSM303DLHC are accessible through two separate I²C serial interfaces, one for the accelerometer core and one for the magnetometer core.

Table 9. Serial interface pin description

Pin name	Pin description
SCL	I ² C serial clock (SCL)
SDA	I ² C serial data (SDA)

5.1 I²C serial interface

The LSM303DLHC I²C is a bus slave. The I²C is employed to write the data into the registers whose content can also be read back.

The relevant I²C terminology is given in the table below.

Table 10. Serial interface pin description

Term	Description
Transmitter	The device which sends data to the bus
Receiver	The device which receives data from the bus
Master	The device which initiates a transfer, generates clock signals, and terminates a transfer
Slave	The device addressed by the master

There are two signals associated with the I²C bus, the serial clock line (SCL) and the serial data line (SDA). The latter is a bidirectional line used for sending and receiving the data to/from the interface.

5.1.1 I²C operation

The transaction on the bus is started through a START (ST) signal. A START condition is defined as a high-to-low transition on the data line while the SCL line is held high. After this has been transmitted by the master, the bus is considered busy. The next byte of data transmitted after the start condition contains the address of the slave in the first 7 bits and bit 8 tells whether the master is receiving data from the slave or transmitting data to the slave. When an address is sent, each device in the system compares the first seven bits after a start condition with its address. If they match, the device considers itself addressed by the master.

Data transfer with acknowledge is mandatory. The transmitter must release the SDA line during the acknowledge pulse. The receiver must then pull the data line low so that it remains stable low during the high period of the acknowledge clock pulse. A receiver which has been addressed is obliged to generate an acknowledge after each byte of data received.

The I²C embedded inside the LSM303DLHC behaves like a slave device and the following protocol must be adhered to. After the START condition (ST) a slave address is sent, once a slave acknowledge (SAK) has been returned, an 8-bit sub-address (SUB) is transmitted; the 7 LSBs represent the actual register address while the MSB enables address auto-increment. If the MSB of the SUB field is '1', the SUB (register address) is automatically increased to allow multiple data Read/Write.

Table 11. Transfer when master is writing one byte to slave

Master	ST	SAD + W		SUB		DATA		SP
Slave			SAK		SAK		SAK	

Table 12. Transfer when master is writing multiple bytes to slave:

Master	ST	SAD + W		SUB		DATA		DATA		SP
Slave			SAK		SAK		SAK		SAK	

Table 13. Transfer when master is receiving (reading) one byte of data from slave:

Master	ST	SAD + W		SUB		SR	SAD + R			NMAK	SP
Slave			SAK		SAK			SAK	DATA		

Data are transmitted in byte format (DATA). Each data transfer contains 8 bits. The number of bytes transferred per transfer is unlimited. Data is transferred with the most significant bit (MSB) first. If a receiver can't receive another complete byte of data until it has performed some other function, it can hold the clock line SCL low to force the transmitter into a wait state. Data transfer only continues when the receiver is ready for another byte and releases the data line. If a slave receiver doesn't acknowledge the slave address (i.e. it is not able to receive because it is performing some real-time function) the data line must be left high by the slave. The master can then abort the transfer. A low-to-high transition on the SDA line while the SCL line is high is defined as a STOP condition. Each data transfer must be terminated by the generation of a STOP (SP) condition.

5.1.2 Linear acceleration digital interface

For linear acceleration the default (factory) 7-bit slave address is 0011001b.

The slave address is completed with a Read/Write bit. If the bit is '1' (read), a repeated START (SR) condition must be issued after the two sub-address bytes; if the bit is '0' (write) the master transmits to the slave with the direction unchanged. [Table 14](#) explains how the read/write bit pattern is composed, listing all the possible configurations.

Table 14. SAD+Read/Write patterns

Command	SAD[7:1]	R/W	SAD+R/W
Read	0011001	1	00110011 (33h)
Write	0011001	0	00110010 (32h)

In order to read multiple bytes, it is necessary to assert the most significant bit of the sub-address field. In other words, SUB(7) must be equal to 1 while SUB(6-0) represents the address of the first register to be read.

In the presented communication format, MAK is master acknowledge and NMAK is no master acknowledge.

Table 15. Transfer when master is receiving (reading) multiple bytes of data from slave

Master	ST	SAD +W		SUB		SR	SAD +R			MAK		MAK		NMAK	SP
Slave			SAK		SAK		SAK	DATA		DATA		DATA			

5.1.3 Magnetic field digital interface

For magnetic sensors the default (factory) 7-bit slave address is 0011110xb.

The slave address is completed with a Read/Write bit. If the bit is '1' (read), a repeated START (SR) condition must be issued after the two sub-address bytes. If the bit is '0' (write) the master transmits to the slave with the direction unchanged. [Table 16](#) explains how the SAD is composed.

Table 16. SAD

Command	SAD[6:0]	R/W	SAD+R/W
Read	0011110	1	00111101 (3Dh)
Write	0011110	0	00111100 (3Ch)

Magnetic signal interface reading/writing

The interface uses an address pointer to indicate which register location is to be read from or written to. These pointer locations are sent from the master to this slave device and succeed the 7-bit address plus 1 bit Read/Write identifier.

To minimize the communication between the master and magnetic digital interface of LSM303DLHC, the address pointer updates automatically without master intervention.

This automatic address pointer update has two additional features. First, when address 12 or higher is accessed, the pointer updates to address 00, and secondly, when address 08 is reached, the pointer rolls back to address 03. Logically, the address pointer operation functions as shown below.

If (address pointer = 08) then the address pointer = 03

Or else, if (address pointer \geq 12) then the address pointer = 0

Or else, (address pointer) = (address pointer) + 1

The address pointer value itself cannot be read via the I²C bus.

Any attempt to read an invalid address location returns 0, and any write to an invalid address location, or an undefined bit within a valid address location, is ignored by this device.

6 Register mapping

[Table 17](#) provides a listing of the 8-bit registers embedded in the device and the corresponding addresses:

Table 17. Register address map

Registers marked as “Reserved” must not be changed. Writing to these registers may cause permanent damage to the device.

The content of the registers that are loaded at boot should not be changed. They contain the factory calibrated values. Their content is automatically restored when the device is powered up.

7 Register description

The device contains a set of registers which are used to control its behavior and to retrieve acceleration data. The register address, made up of 7 bits, is used to identify them and to write the data through the serial interface.

7.1 Linear acceleration register description

7.1.1 CTRL_REG1_A (20h)

Table 18. CTRL_REG1_A register

ODR3	ODR2	ODR1	ODR0	LPen	Zen	Yen	Xen
------	------	------	------	------	-----	-----	-----

Table 19. CTRL_REG1_A description

ODR[3:0]	Data rate selection. Default value: 0000 (0000: power-down, others: refer to Table 20)
LPen	Low-power mode enable. Default value: 0 (0: normal mode, 1: low-power mode)
Zen	Z-axis enable. Default value: 1 (0: Z-axis disabled, 1: Z-axis enabled)
Yen	Y-axis enable. Default value: 1 (0: Y-axis disabled, 1: Y-axis enabled)
Xen	X-axis enable. Default value: 1 (0: X-axis disabled, 1: X-axis enabled)

ODR[3:0] is used to set the power mode and ODR selection. In the following table bit selection of ODR [3:0] for all frequencies is shown.

Table 20. Data rate configuration

ODR3	ODR2	ODR1	ODR0	Power mode and ODR selection
0	0	0	0	Power-down mode
0	0	0	1	Normal / low-power mode (1 Hz)
0	0	1	0	Normal / low-power mode (10 Hz)
0	0	1	1	Normal / low-power mode (25 Hz)
0	1	0	0	Normal / low-power mode (50 Hz)
0	1	0	1	Normal / low-power mode (100 Hz)
0	1	1	0	Normal / low-power mode (200 Hz)
0	1	1	1	Normal / low-power mode (400 Hz)
1	0	0	0	Low-power mode (1.620 kHz)
1	0	0	1	Normal (1.344 kHz) / low-power mode (5.376 kHz)

1. This bit must be set to '0' for correct operation of the device.

Table 53. INT2_SRC_A description

IA	Interrupt active. Default value: 0 (0: no interrupt has been generated, 1: one or more interrupts have been generated)
ZH	Z high. Default value: 0 (0: no interrupt, 1: Z high event has occurred)
ZL	Z low. Default value: 0 (0: no interrupt, 1: Z low event has occurred)
YH	Y high. Default value: 0 (0: no interrupt, 1: Y high event has occurred)

Table 53. INT2_SRC_A description (continued)

YL	Y low. Default value: 0 (0: no interrupt, 1: Y low event has occurred)
XH	X high. Default value: 0 (0: no interrupt, 1: X high event has occurred)
XL	X Low. Default value: 0 (0: no interrupt, 1: X low event has occurred)

Interrupt 2 source register. Read-only register.

Reading at this address clears the INT2_SRC IA bit (and the interrupt signal on the INT2 pin) and allows the refresh of data in the INT2_SRC register if the latched option was chosen.

7.1.20 INT2_THS_A (36h)

Table 54. INT2_THS_A register

0 ⁽¹⁾	THS6	THS5	THS4	THS3	THS2	THS1	THS0
------------------	------	------	------	------	------	------	------

1. This bit must be set to '0' for correct operation of the device.

Table 55. INT2_THS_A description

THS[6:0]	Interrupt 2 threshold. Default value: 000 0000
----------	--

7.1.21 INT2_DURATION_A (37h)

Table 56. INT2_DURATION_A register

0 ⁽¹⁾	D6	D5	D4	D3	D2	D1	D0
------------------	----	----	----	----	----	----	----

1. This bit must be set to '0' for correct operation of the device.

Table 57. INT2_DURATION_A description

D[6:0]	Duration value. Default value: 000 0000
--------	---

D6 - D0 bits set the minimum duration of the Interrupt 2 event to be recognized. Duration time steps and maximum values depend on the ODR chosen.

7.1.22 CLICK_CFG_A (38h)

Table 58. CLICK_CFG_A register

--	--	ZD	ZS	YD	YS	XD	XS
----	----	----	----	----	----	----	----

Table 59. CLICK_CFG_A description

ZD	Enable interrupt double-click on Z-axis. Default value: 0 (0: disable interrupt request, 1: enable interrupt request on measured accel. value higher than preset threshold)
ZS	Enable interrupt single-click on Z-axis. Default value: 0 (0: disable interrupt request, 1: enable interrupt request on measured accel. value higher than preset threshold)
YD	Enable interrupt double-click on Y-axis. Default value: 0 (0: disable interrupt request, 1: enable interrupt request on measured accel. value higher than preset threshold)
YS	Enable interrupt single-click on Y-axis. Default value: 0 (0: disable interrupt request, 1: enable interrupt request on measured accel. value higher than preset threshold)
XD	Enable interrupt double-click on X-axis. Default value: 0 (0: disable interrupt request, 1: enable interrupt request on measured accel. value higher than preset threshold)
XS	Enable interrupt single-click on X-axis. Default value: 0 (0: disable interrupt request, 1: enable interrupt request on measured accel. value higher than preset threshold)

7.1.23 CLICK_SRC_A (39h)

Table 60. CLICK_SRC_A register

--	IA	DCLICK	SCLICK	Sign	Z	Y	X
----	----	--------	--------	------	---	---	---

Table 61. CLICK_SRC_A description

IA	Interrupt active. Default value: 0 (0: no interrupt has been generated, 1: one or more interrupts have been generated)
DCLICK	Double-click enable. Default value: 0 (0: double-click detection disable, 1: double-click detection enable)
SCLICK	Single-click enable. Default value: 0 (0: Single-click detection disable, 1: single-click detection enable)
Sign	Click sign. 0: positive detection, 1: negative detection
Z	Z-click detection. Default value: 0 (0: no interrupt, 1: Z high event has occurred)
Y	Y-click detection. Default value: 0 (0: no interrupt, 1: Y high event has occurred)
X	X-click detection. Default value: 0 (0: no interrupt, 1: X high event has occurred)

7.1.24 CLICK_THS_A (3Ah)

Table 62. CLICK_THS_A register

--	Ths6	Ths5	Ths4	Ths3	Ths2	Ths1	Ths0
----	------	------	------	------	------	------	------

Table 63. CLICK_SRC_A description

Ths[6:0]	Click threshold. Default value: 000 0000
----------	--

1 LSB = full-scale / 128. Ths6 through Ths0 define the threshold which is used by the system to start the click-detection procedure. The threshold value is expressed over 7 bits as an unsigned number.

7.1.25 TIME_LIMIT_A (3Bh)

Table 64. TIME_LIMIT_A register

--	TLI6	TLI5	TLI4	TLI3	TLI2	TLI1	TLI0
----	------	------	------	------	------	------	------

Table 65. TIME_LIMIT_A description

TLI[6:0]	Click time limit. Default value: 000 0000
----------	---

1 LSB = 1/ODR. TLI6 through TLI0 define the maximum time interval that can elapse between the start of the click-detection procedure (the acceleration on the selected channel exceeds the programmed threshold) and when the acceleration falls below the threshold.

7.1.26 TIME_LATENCY_A (3Ch)

Table 66. TIME_LATENCY_A register

TLA7	TLA6	TLA5	TLA4	TLA3	TLA2	TLA1	TLA0
------	------	------	------	------	------	------	------

Table 67. TIME_LATENCY_A description

TLA[7:0]	Double-click time latency. Default value: 0000 0000
----------	---

1 LSB = 1/ODR. TLA7 through TLA0 define the time interval that starts after the first click detection where the click-detection procedure is disabled, in cases where the device is configured for double-click detection.

7.1.27 TIME_WINDOW_A (3Dh)

Table 68. TIME_WINDOW_A register

TW7	TW6	TW5	TW4	TW3	TW2	TW1	TW0
-----	-----	-----	-----	-----	-----	-----	-----

Table 69. TIME_WINDOW_A description

TW[7:0]	Double-click time window
---------	--------------------------

1 LSB = 1/ODR. TW7 through TW0 define the maximum interval of time that can elapse after the end of the latency interval in which the click detection procedure can start, in cases where the device is configured for double-click detection.

7.2 Magnetic field sensing register description

7.2.1 CRA_REG_M (00h)

Table 70. CRA_REG_M register

TEMP_EN	0 ⁽¹⁾	0 ⁽¹⁾	DO2	DO1	DO0	0 ⁽¹⁾	0 ⁽¹⁾
---------	------------------	------------------	-----	-----	-----	------------------	------------------

1. This bit must be set to '0' for correct operation of the device.

Table 71. CRA_REG_M description

TEMP_EN	Temperature sensor enable. 0: temperature sensor disabled (default), 1: temperature sensor enabled
DO[2:0]	Data output rate bits. These bits set the rate at which data is written to all three data output registers (refer to Table 72). Default value: 100

Table 72. Data rate configurations

DO2	DO1	DO0	Minimum data output rate (Hz)
0	0	0	0.75
0	0	1	1.5
0	1	0	3.0
0	1	1	7.5
1	0	0	15
1	0	1	30
1	1	0	75
1	1	1	220

7.2.2 CRB_REG_M (01h)

Table 73. CRB_REG_M register

GN2	GN1	GN0	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾
-----	-----	-----	------------------	------------------	------------------	------------------	------------------

1. This bit must be set to '0' for correct operation of the device.

Table 74. CRB_REG_M description

GN[2:0]	Gain configuration bits. The gain configuration is common for all channels (refer to Table 75)
---------	---

Table 75. Gain setting

GN2	GN1	GN0	Sensor input field range [Gauss]	Gain X, Y, and Z [LSB/Gauss]	Gain Z [LSB/Gauss]	Output range
0	0	1	±1.3	1100	980	0xF800–0x07FF (-2048 to +2047)
0	1	0	±1.9	855	760	
0	1	1	±2.5	670	600	
1	0	0	±4.0	450	400	
1	0	1	±4.7	400	355	
1	1	0	±5.6	330	295	
1	1	1	±8.1	230	205	

7.2.3 MR_REG_M (02h)

Table 76. MR_REG_M register

0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	0 ⁽¹⁾	MD1	MD0
------------------	------------------	------------------	------------------	------------------	------------------	-----	-----

1. This bit must be set to '0' for correct operation of the device.

Table 77. MR_REG_M description

MD[1:0]	Mode select bits. These bits select the operation mode of this device (refer to Table 78)
---------	--

Table 78. Magnetic sensor operating mode

MD1	MD0	Mode
0	0	Continuous-conversion mode
0	1	Single-conversion mode
1	0	Sleep mode. Device is placed in sleep mode
1	1	Sleep mode. Device is placed in sleep mode

7.2.4 OUT_X_H_M (03), OUT_X_L_M (04h)

X-axis magnetic field data. The value is expressed as two's complement.

7.2.5 OUT_Z_H_M (05), OUT_Z_L_M (06h)

Z-axis magnetic field data. The value is expressed as two's complement.

7.2.6 OUT_Y_H_M (07), OUT_Y_L_M (08h)

Y-axis magnetic field data. The value is expressed as two's complement.

7.2.7 SR_REG_M (09h)**Table 79. SR_REG_M register**

--	--	--	--	--	--	LOCK	DRDY
----	----	----	----	----	----	------	------

Table 80. SR_REG_M description

LOCK	Data output register lock. Once a new set of measurements is available, this bit is set when the first magnetic field data register has been read.
DRDY	Data-ready bit. This bit is set when a new set of measurements is available.

7.2.8 IRx_REG_M (0Ah/0Bh/0Ch)**Table 81. IRA_REG_M register**

0	1	0	0	1	0	0	0
---	---	---	---	---	---	---	---

Table 82. IRB_REG_M register

0	0	1	1	0	1	0	0
---	---	---	---	---	---	---	---

Table 83. IRC_REG_M register

0	0	1	1	0	0	1	1
---	---	---	---	---	---	---	---

7.2.9 TEMP_OUT_H_M (31h), TEMP_OUT_L_M (32h)**Table 84. TEMP_OUT_H_M register**

TEMP11	TEMP10	TEMP9	TEMP8	TEMP7	TEMP6	TEMP5	TEMP4
--------	--------	-------	-------	-------	-------	-------	-------

Table 85. TEMP_OUT_L_M register

TEMP3	TEMP2	TEMP1	TEMP0	--	--	--	--
-------	-------	-------	-------	----	----	----	----

Table 86. TEMP_OUT resolution

TEMP[11:0]	Temperature data (8 LSB/deg - 12-bit resolution). The value is expressed as two's complement.
------------	---

8 Package information

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK[®] packages, depending on their level of environmental compliance. ECOPACK[®] specifications, grade definitions and product status are available at: www.st.com. ECOPACK[®] is an ST trademark.

9 Revision history

Table 87. Document revision history

Date	Revision	Changes
21-Apr-2011	1	Initial release
05-Nov-2013	2	Document status promoted from preliminary to production data Added ESD to Table 7 Minor textual updates throughout document

Please Read Carefully:

Information in this document is provided solely in connection with ST products. STMicroelectronics NV and its subsidiaries ("ST") reserve the right to make changes, corrections, modifications or improvements, to this document, and the products and services described herein at any time, without notice.

All ST products are sold pursuant to ST's terms and conditions of sale.

Purchasers are solely responsible for the choice, selection and use of the ST products and services described herein, and ST assumes no liability whatsoever relating to the choice, selection or use of the ST products and services described herein.

No license, express or implied, by estoppel or otherwise, to any intellectual property rights is granted under this document. If any part of this document refers to any third party products or services it shall not be deemed a license grant by ST for the use of such third party products or services, or any intellectual property contained therein or considered as a warranty covering the use in any manner whatsoever of such third party products or services or any intellectual property contained therein.

UNLESS OTHERWISE SET FORTH IN ST'S TERMS AND CONDITIONS OF SALE ST DISCLAIMS ANY EXPRESS OR IMPLIED WARRANTY WITH RESPECT TO THE USE AND/OR SALE OF ST PRODUCTS INCLUDING WITHOUT LIMITATION IMPLIED WARRANTIES OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE (AND THEIR EQUIVALENTS UNDER THE LAWS OF ANY JURISDICTION), OR INFRINGEMENT OF ANY PATENT, COPYRIGHT OR OTHER INTELLECTUAL PROPERTY RIGHT.

ST PRODUCTS ARE NOT DESIGNED OR AUTHORIZED FOR USE IN: (A) SAFETY CRITICAL APPLICATIONS SUCH AS LIFE SUPPORTING, ACTIVE IMPLANTED DEVICES OR SYSTEMS WITH PRODUCT FUNCTIONAL SAFETY REQUIREMENTS; (B) AERONAUTIC APPLICATIONS; (C) AUTOMOTIVE APPLICATIONS OR ENVIRONMENTS, AND/OR (D) AEROSPACE APPLICATIONS OR ENVIRONMENTS. WHERE ST PRODUCTS ARE NOT DESIGNED FOR SUCH USE, THE PURCHASER SHALL USE PRODUCTS AT PURCHASER'S SOLE RISK, EVEN IF ST HAS BEEN INFORMED IN WRITING OF SUCH USAGE, UNLESS A PRODUCT IS EXPRESSLY DESIGNATED BY ST AS BEING INTENDED FOR "AUTOMOTIVE, AUTOMOTIVE SAFETY OR MEDICAL" INDUSTRY DOMAINS ACCORDING TO ST PRODUCT DESIGN SPECIFICATIONS. PRODUCTS FORMALLY ESCC, QML OR JAN QUALIFIED ARE DEEMED SUITABLE FOR USE IN AEROSPACE BY THE CORRESPONDING GOVERNMENTAL AGENCY.

Resale of ST products with provisions different from the statements and/or technical features set forth in this document shall immediately void any warranty granted by ST for the ST product or service described herein and shall not create or extend in any manner whatsoever, any liability of ST.
